I *Anish Punaroor* intend to become a Software Engineer.

To this end I need to:

- *Always remember to meet the needs of my customers/clients when developing software.*
- *Aspire to write high quality code that co-workers can understand, and not rely on others to fix bugs and errors that stem from my code contributions.*
- *Learn to plan ahead and thoroughly outline the specifications of a software product before programming and actually developing the software.*
- *Aim to create software with the intent of not only satisfying the client, but also keeping in mind the interest of the public and the software's benefit to society.*
- *Understand the repercussions of not applying my best effort as a software engineer, and recognize the consequences of deploying faulty and incomplete software.*
- *Become better at collaborating and cooperating with teammates/co-workers, ensuring that everyone is on the same page when developing software.*
- *Realize that software engineering emphasizes Agile development methodologies like Scrum, where rapid iteration is encouraged, and recognize that this may not always be the best approach when developing software.*
- *Treat software engineering as a field where I fulfill my responsibility to the public.*

After this class I expect to be 25% of the way towards my goal. I expect this effort will take me 5 *years* to fully achieve.
